

# The #1 workforce management tool built for construction

Bridgit Bench

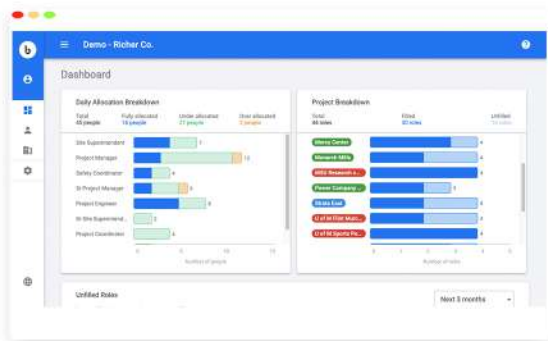

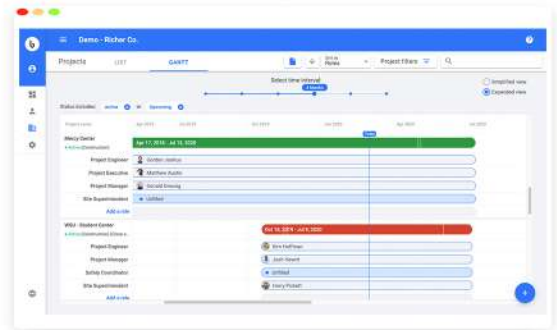

## Optimize allocations and utilization rate

Field productivity is the highest project cost in the construction industry. Being able to optimize your workforce improves utilization and ensure the right people are on the right projects, both of which impact your bottom line.

## Improve visibility, reduce “bench cost”

Bridgit Bench provides both People and Project Gantt views to give your operations team visibility over gaps in labor and opportunities to take on new projects. This leads to increased operational efficiencies as no one is left without work and “on the bench”.

## Data-driven decisions to improve your bottom line

Nothing slows a project down faster than needless re-work due to project decisions being made on dated, or inaccurate data. Having your people and projects updated in real time creates a single source of truth to enable data-driven decision making.

**“We didn’t have forward thinking, so we didn’t know how much staffing we would need in the future. Bridgit Bench allows us to adjust accordingly, since we have better total insight of how the personnel we have are being used.”**

Stephen Miller, VP Operations at Andres Construction
